

# Automatic Optical Fiber Monitoring Instrument

## Overview

---

An Automatic Optical Cable Monitoring System (FAMS/TMS400) is a centralized remote testing platform that utilizes RTUs (Remote Test Units) and OTDR technology to scan fiber networks 24/7. Fiber optic networks are the backbone of modern communication and control systems, both in telecommunications, rail and road transport, and in energy and industrial infrastructure. At the same time, they are sensitive to external influences such as moisture, mechanical damage, kinks, or. It automatically detects, locates, and alerts operators to breaks, bends, and attenuation in real-time. FS optical transmission link monitoring solution integrates OPD, OTDR, and OSW monitoring cards to deliver enhanced optical performance, enabling real-time fault detection, precise fault location, and proactive network maintenance, which reduces downtime and operational costs. TeliSwitch AFMS system enables monitoring of all kinds of optical networks with central optical testing devices, such as OTDR.
