

Can the wavelength of an optical module be tested

Overview

Since the optical modules used on the devices at both ends must emit the same wavelength to establish communication, the manufacturer must test the wavelength of the optical module before shipment to ensure that it is within the deviation range. Every module of QSPTEK has undergone rigorous testing, if it has some problem, it will go back to the production line for modulation, if there is. After the assembly of the optical module is completed, a number of parameter tests are needed to test the signals at the transmitting end (TX) and receiving ends (RX). Only when the parameters like average output optical power, extinction ratio, optical modulation amplitude (OMA), bit error rate.
