

Drilling holes in the cable tray cover

Overview

To avoid transverse bending at higher loads, a joint plate must be used for tray widths of 400 mm or more in the joint area of the cable trays that are to be connected. By drilling bolt holes in the cable tray and securing the cover with bolts, this method allows for easy adjustments to the cover's position. A short piece of side rail that is punched with the standard factory hole pattern can be bolted to. Mark the cable tray route based on your electrical cable tray design and site layout.
