

# Filling in excess space in the distribution box

Dimensions:

## Overview

---

Void fillers are materials used to fill the empty gaps and extra space in your packaging. They're used to protect your product during transportation by minimizing its shifting around, while also absorbing shock. It is common for a shipped box to be tossed multiple times from truck to truck, until it finally lands on the customer's front porch. This strategic packaging method transcends the mere containment of items within a box; it involves filling the voids, creating a shield that minimizes the risk of damage during transit. If you can't comfortably drop the package on the ground from several feet up, then void fill is recommended.
