

Glue application to distribution box

Overview

Adhesive Application: Glue is applied to the flute tips (peaks on the fluted structure) of the corrugated medium. **Liner Attachment:** The first liner is pressed onto the adhesive, creating a single-face web. The DV-01 is a basic time pressure valve that is simple to use and set up. The DV-03HPA is a compact, air-actuated balanced spool valve with stainless steel construction. The DV-05A is an adjustable, air-actuated diaphragm poppet valve with high chemical resistance. The DV-07 is a normally closed. In this complete guide, we'll investigate the common issues in adhesive application that can throw a wrench in your packaging line - complete with actionable troubleshooting advice. When glue is applied unevenly — either too much or too little in certain areas — it causes a chain reaction of quality problems: weak bonding, moisture imbalance, longer drying times, warping, and poor printing surfaces. During the high-speed process of carton forming and sealing, both corrugated cardboard and hot melt adhesives are exposed to conditions like friction and dry.
