

HFC coaxial cable hybrid optical cable

Overview

Hybrid Fiber-Coax (HFC) is a telecommunications network architecture that combines two different types of transmission mediums, namely optical fiber and coaxial cable, to provide high-speed data, video, and voice services to homes and businesses. It has been commonly employed globally by cable television operators since the early 1990s. Multiple System Operators (MSOs) networks are evolving, with fiber extending deeper into the network as operators transition to a passive hybrid fiber-coaxial (HFC) network and deploy full fiber to the home in greenfield builds. Key components: Headend for signal origination, optical nodes converting light to RF, and amps/taps distributing to homes. Here's why HFC stands out: High Bandwidth: Hybrid fiber optic cable systems provide ample bandwidth for high-definition video, internet access, and telephony.
