

# High-voltage busbar trunking inspection

## Overview

---

Daily Inspection: Visually inspect the busbars for any abnormalities such as cracks, rust, deformation, or discoloration. Dielectric testing ensures the insulation of busbars can withstand the operating voltage and environmental conditions without breaking down. The purpose of this method is to verify the functionalities of a Metal Enclosed Busbar. The test shall be carried out according to IEC 60068-2-2 Test Bb, at a temperature of 70 °C, with natural air circulation, for a duration of 168 h (7 days) and with a recovery of 96 h (4 days). Our team utilises fully calibrated equipment for inspecting, servicing, and conducting electrical tests and diagnostics to address busbar performance issues. Earth tester Multimeter | Continuity tester Megger Tester Technician's tools Calibration.
