

How many kilometers is a fiber optic patch cord

Overview

For a typical office or datacenter, standard-length patch cords in the range of 2m to 10m are often all that is needed. A patch cord is an essential component of a fiber optic setup, being cost-efficient while being compatible with most devices and easy to find in stores. It is essential so the data may pass rapidly and without slowing down through the wires connecting. These fibers are designed to carry large amounts of data over long distances with minimal signal loss. A fiber optic patch cable (also called a fiber jumper or fiber patch cord) is a section of optical fiber cable with connector terminations on both ends, designed for flexible, short-distance interconnections within an optical network. In a perfect, lab-like setting without signal degradation, fiber optics could theoretically transmit data for hundreds of thousands of kilometers.
