

# **How was the fiber optic communication experiment**

## Overview

---

This experiment by Colladon established that light could be transmitted through media like water and glass fibers using successive total internal reflections, forming the basis for modern fiber optics. The first commercial test of fiber-optic telecommunications took place on May 11, 1977, in downtown Chicago, marking a significant milestone in the evolution of communication technology. It started in the 1960s as a physics experiment and now forms the backbone of the internet, changing how information zips around the planet. Fiber optic communication has revolutionized the way data is transmitted across the globe, enabling ultra-fast, reliable, and secure connectivity. This technology's journey spans nearly two centuries, marked by groundbreaking innovations and relentless research.

## How was the fiber optic communication experiment

---

### How Fiber Optics Was Invented

Fiber optics were invented by Corning Glass researchers to improve data transmission over long distances. Fiber optics allow light to travel through
