

Micro-module without root access

Overview

This repository contains tools and scripts for performing advanced Android operations without root access, including boot image extraction, recovery-mode access, OTG flashing, Magisk preparation, and adb automation. microG is a FLOSS (Free/libre and Open Source Software) reimplement of proprietary malware apps Google Play Services and Google Play Store. It doesn't spy on you, doesn't eat up system resources and doesn't allow Google (or other people) backdoors into your device. Specifically, I'm wondering if MicroG passes SafetyNet by default without the need for root access and Magisk modules such as the one provided by kdrag0n's safetynet-fix (<https://github.com/kdrag0n/safetynet-fix>). Zero in on the power of Magisk modules without sacrificing your device's warranty - we'll show you how to install them safely. Tired of a cookie-cutter Android experience?

Break free with Magisk, the all-in-one toolbox that lets you manage root permissions with ease and bolt on clever modules to.
