

Multimode fiber optic patch cord distance

Overview

OM4 is common for distances up to 150 meters in 100G SR4 applications, while OM5 (Wideband Multimode Fiber) is optimized for short-wave division multiplexing (SWDM). Most of the time, OM2 fiber was used for 1G Ethernet interconnection in distances up to 550 meters. Singlemode fiber has a narrow core diameter of 9/125 microns, which allows light to travel in a single path (mode). Attenuation is the weakening of light as it comes in from the transmitting end of the fiber and out of the transmitting end. This guide explains single mode and multimode optical fiber differences in structure, distance, cost, transfer speed, types of connectors, and of widely used network standards, so that you can have a better knowledge and confidently make a decision on which Fiber fits your application requirements.
