

National Standard Terminology for Fiber Optic Panels

Overview

5 Telecommunications Infrastructure Terms and Symbols Subcommittee and published in July, 2017. Scope: This Standard defines commonly used terms, symbols, and abbreviations for optical fiber applications. Fiber optic power meters are used to measure microwatts (mW), Decibels (dB), and decibel milliwatts (dBm, which are some of the most common measurements of light in fiber optics. Singlemode Fiber (SM / SMF): Fiber with a small core (~9 μ m) that allows only one mode of light. Standard test method used primarily in aerospace and spacecraft applications to evaluate how much an epoxy material outgasses in a vacuum environment to ensure they meet the total weight loss (TML) and condensable volatile material (CVCM) thresholds. Made from high-quality glass, silica, or plastic, it serves as the backbone of the internet and telecommunication infrastructure.
