

Noise from the electrical distribution box in the hallway

Overview

Electrical box buzzing can stem from loose wiring, faulty breakers, overloaded circuits, grounding issues, or panel aging. Prompt professional attention is crucial to prevent potential hazards and ensure a safe electrical system. This could be due to natural wear and tear, poor installation, or animals chewing on exposed wiring. While electricity can be dangerous, the current in your wiring is almost always safely insulated with a protective layer of rubber or similar material. The noise has been identified as coming from the electrical distribution box which is attached to a cement wall that runs up all three floors in my bedroom as a firewall. When they start tripping, overheating, or making strange noises, it's more than just an inconvenience - it's your home's cry for help. It's supposed to sit behind a door or panel and do its job without making a peep. It is weird that I can hear it very clearly in my room where it is directly connected to, but the one just next to it on the same side of wall, I can't hear.
