

Polarization of Elastic Modulator

Overview

Photoelastic Modulators (PEMs) are sophisticated optical devices that leverage the photoelastic effect to dynamically modulate the polarization of light. This effect involves inducing birefringence within an optical element by applying mechanical stress. Their ability to modulate light polarization at high frequencies has made them indispensable tools in various scientific and industrial.

Polarization of Elastic Modulator

Longitudinal piezoelectric resonant photoelastic modulator for

Transverse resonant photoelastic modulators, where the acoustic wave propagates perpendicularly to the optical wave, have an inherent trade-off between aperture size and modulation frequency
