

**ZTP Thermal & Power**

# **Solution Flame Retardant Network Cabinets**

## Overview

---

Fire-retardant materials are engineered to slow ignition, limit flame spread, reduce heat release, and minimize toxic or opaque smoke, helping to protect equipment, data, and—most importantly—people. A standard network cabinet is mainly designed for equipment installation, cable organization, ventilation, and routine physical protection, while a fire-resistant solution is built and tested for defined fire performance. This IT server cabinet fireproof is the solution for highest fire and IT security requirements. As a complete, compact data center with all infrastructures such as air conditioning, UPS, monitoring, etc. We have developed TITANUS RACK•SENS ® to quickly localize a potential start of the fire in a closed server or control cabinet and thus detect it as early as possible. What they have in common is that they are generally business critical assets, where an outage will lead to significant losses through downtime and consequential.
