

# **The optical switch cannot be started**

## Overview

---

If possible, remove and reinstall the optical modules to check whether the fault is rectified. This document describes how to troubleshoot fiber optic interfaces by addressing some of the fiber optic module and cabling specifications. Am I missing something or the optical monitoring only works when the link is up?

I am trying to troubleshoot some fiber connections which were unreliable / not coming up and when I use the ``show optical-monitor x/y/z`` command, I get nothing. Those messages tell you what the switch detected (authentication mismatch, bad EEPROM, unsupported part number, PHY disagreement) and point to a small set of concrete checks.
