

# What does it mean when the alarm on the optical transmitter is lit

## Overview

---

An OTN (Optical Transport Network) alarm is a notification mechanism that indicates the occurrence of an error, defect, or anomaly in the optical network infrastructure. These alarms are raised when network equipment detects a fault in the transmission, reception, or processing of. Underneath the box, from left to right, are 3 connectors - power, LAN out, optical fibre in, That middle one is the one that goes to your router. As you can see there are 4 lights at the top of the OpenReach Full Fibre modem - Power, LOS (Loss of Service or Loss of Signal), PON (Passive Optical. An Optical Network Terminal (ONT)—also known as Customer Premises Equipment (CPE)—is the small box installed inside your home that connects your fibre router to the wider fibre network.
