Overview

An Ethernet splitter, also known as a network splitter or LAN splitter, is a device designed to divide one Ethernet connection into multiple outputs. The idea is to allow you to run two Ethernet devices along a single cable without having to purchase and power a switch or run more cables. This qualifies it as a "full duplex" device, as it intelligently receives and transmits the data packets at the same time, resulting in a faster network. It looks simple enough, just a box or adapter with extra jacks, but its role in your network isn't always clear.
