

What s going on with both the TX and RX transceivers being plugged into fiber optic cables

Overview

99% of the time, the problem is fiber polarity — specifically, Transmit (Tx) talking to Transmit and Receive (Rx) talking to Receive instead of Tx ↔ Rx. Good news: it's incredibly easy to understand and fix once you know the "two-lane highway" rule. Your Fiber cabling is complete and you've inserted brand-new SFPs, cleaned the connectors, and used what looks like a perfect fiber patch cable. Although it may seem obvious, fiber optic polarity is a frequent source of confusion and. ☐☐ Ideal: RX power should be within the range the receiver can handle — not too low, not too high. Optical transceivers are essential components in modern fiber-optic networks, enabling high-speed data transmission across data centers, telecom systems, industrial automation, and enterprise switching environments.
