

What type of product is optical fiber cable

Overview

Innerducts are installed in existing underground conduit systems to provide clean, continuous, low-friction paths for placing optical cables that have relatively low pulling tension limits. They provide a means for subdividing conventional that was originally designed for single, large-diameter metallic conductor cables into multiple channels for smaller optical cables. It is reliable, versatile, and widely used in many applications and industries. Unlike copper wires, which are limited by lower data transmission speeds, shorter transmission distances, and higher susceptibility to electromagnetic interference, fiber optic cables offer unparalleled performance and can cover much greater distances without bumping up against signal degradation. A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry. Fiber optic cable powers modern communication across telecom networks, broadband infrastructure, industrial systems, defense platforms, marine environments, ROV operations, and custom engineered applications.
